## Legal information and warnings

This manual may not be altered or reproduced in whole or in part by any means, without expressed written permission of DEIF.
The information contained in this document is believed to be accurate at the time of publication, however, DEIF assumes no responsibility for any errors which may appear here and reserves the right to make changes without notice. Please ask your local representative for the latest product specifications before ordering.

Please read this manual carefully before installation, operation and maintenance of the MIC-2 multi-instrument. The following symbols are used in this user's manual and on the MIC-2 multi-instrument:

High voltage symbol. Electrical hazard voltage can cause shock, burns or person injury or death. Failure to observe the information may result in injury or death.

Danger symbol. Observe the information after the symbol to avoid possible injury or death.

Installation and maintenance of the MIC-2 multi-instrument should only be performed by qualified, competent personnel trained and experienced in working with high voltages and currents.

This document is not fit for any untrained people. DEIF is not responsible or liable for any damages cause by improper installation and/or operation.

## Congratulations!

You have purchased an advanced, versatile, multi-function power meter, the MIC-2. The MIC-2 can work as a remote terminal unit (RTU) that contributes to your system's stability and reliability by providing real-time power quality monitoring and analysis.

When you open the package, you will find the following items

1. MIC-2 unit 1
2. Pluggable terminal 3
3. Installation clips 4
4. Rubber gasket 1
5. User's manual 1
6. Maintenance guarantee card 1

Please read this manual carefully before operating or installing the MIC-2 to avoid unnecessary trouble.

## Powerful multifunction power meter

The MIC-2 multi-function digital power meter is designed using modern MCU and DSP technology. It integrates three-phase energy measuring and displaying, energy accumulating, power quality analysis, malfunction alarming, data logging and network communication. Large and vivid LCD meets your visual requirement, and the large character LCD display with backlight provides clear real-time monitoring data readout. The interface makes it easy to master. Multi-row displaying lets you observe various data without touching any keys.

## Ideal choice for electric automation SCADA system

The MIC-2 is the ideal choice for replacing traditional, analogueue electric meters. Apart from providing clear real-time readings on the meter front, it can also be used as a remote terminal unit (RTU) for monitoring and controlling for a SCADA system. Users can access all measurement parameters via the standard RS485 communication port (or the optional Ethernet port) with the Modbus protocol.

## Energy management

The MIC-2 is able to measure bidirectional, four quadrants kWh and kvarh. It provides maximum/minimum records for power usage and power demand parameters. All power and energy parameters, including measurement tables, can be viewed remotely so that users can monitor running load and energy usage status easily.

## Remote power control

The MIC-2 is designed for measuring and monitoring of power quality parameters. Since different I/O modules can be added to the unit, this expands the capability and provides a very flexible platform for using the unit as a distributed RTU, for metering, monitoring and remote controlling, all in one unit.

## Power quality analysis

Utilising digital signal processing (DSP) technology, the MIC-2 provides high accuracy power quality analysis and supports online parameter monitoring. The unit continuously updates metering results and allows users online access to monitor parameters such as voltage and current THD, harmonics up to the 31 st order, voltage crest factor, current K factor, and voltage and current unbalance factor, etc.

### 1.2 Application area

Power distribution automation
Industry automation
Energy management system
Resident district power monitoring

Intelligent electric switch gear
Building automation
Substation automation

### 1.3 Function of the MIC-2

## Multi-function, high accuracy

The MIC-2 offers powerful data collecting and processing functions. In addition to measuring various parameters, the meter is able to perform demand metering, harmonic analysis, max/min statistic recording, over/under limit alarming, energy accumulating, data logging, etc.

Accuracy of voltage and current is $0.2 \%$, true RMS.
Accuracy of power and energy is $0.5 \%$, four quadrants metering.

## Small size and easy installation

The MIC-2 can be installed into a standard ANSI C39.1 (4" round) or an IEC 92 mm DIN (Square) form. With the 51 mm depth after mounting, the unit can be installed in a small cabin. Fixing clips are used for easy installation and removal.

## Easy to use

The MIC-2 has a large, clear and easy to read LCD screen for displaying monitoring parameters. The unit screen with selectable backlight duration can be read easily under poor lighting conditions. All metering data and setting parameters can be accessed by using the front panel keys or via the communication port. Setting parameters are stored in the EEPROM so that content will be maintained even the meter is powered off.

## Multiple wiring modes

The MIC-2 can be used in high voltage, low voltage, three-phase three wires, three-phase four wires and single-phase systems using different wiring mode settings.

High safety, high reliability
The MIC-2 was designed according to industrial standards. It can run reliably under high power disturbance condition as it has passed EMC and safety test according to IEC standards and UL certification.

- Installation of the unit must be performed by qualified personnel only, who follow standard safety precautions through the installation procedures. The personnel must have appropriate training and experience working with high voltage devices. Appropriate safety gloves, safety glasses and protective clothing are recommended.
- During normal operation, dangerous voltage may flow through many parts of the unit, including terminals, and any connected CTs (current transformers) and PTs (potential/voltage transformers), all I/Os (inputs and outputs) modules and their circuits. All primary and secondary circuits can, at times, produce lethal voltages and currents. AVOID contact with any current-carrying surfaces.
- The unit and its I/O output channels are NOT designed as primary protection devices and may NOT be used as primary circuit protection or in an energy-limiting capacity. The unit and its I/O output channels can only be used as secondary protection. AVOID using the unit under situations where failure of the unit may cause injury or death. AVOID using the unit for any application where risk of fire may occur.
- All unit terminals should be inaccessible after installation.
- Do NOT perform Dielectric (HIPOT) test to any inputs, outputs or communication terminals. High voltage testing may damage electronic components of the unit.
- Applying more than the maximum voltage the unit and/or its modules can withstand will permenately damage the unit and/or its modules. Please refer to the specifications for all devices before applying voltages.
- When removing unit for service, use shorting blocks and fuses for voltage leads and power supply to prevent harzardous voltage conditions or damage to CTs. CT grounding is optional.
- DEIF recommends using a dry cloth to wipe the unit.

NOTE: IF THE EQUIPMENT IS USED IN A MANNER NOT SPECIFIED BY THE MANUFACTURER, THE PROTECTION PROVIDED BY THE EQUIPMENT MAY BE IMPAIRED.

NOTE: THERE IS NO REQUIRED PREVENTIVE MAINTENANCE OR INSPECTION NECESSARY FOR SAFETY. HOWEVER, ANY REPAIR OR MAINTENANCE SHOULD BE PERFORMED BY THE FACTORY.

DISCONNECT DEVICE: The following part is considered the equipment disconnect device.

The installation method is introduced in this chapter. Please read it carefully before beginning installation work.

## Appearance

| Part name | Description |
| :--- | :--- |
| 1. Enclosure | The MIC-2 enclosure is made of high strength anti-combustible engineering plastic |
| 2. Front Casing | Visible portion (for display and control) after mounting onto a panel |
| 3. LCD Display | Large bright white backlight LCD display |
| 4. Key | Four keys are used to select display and set |
| 5. Voltage input terminals | Used for voltage input |
| 6. Current input terminals | Used for current input |
| 7. Power supply terminals | Used for aux. power supply input |
| 8. Communication terminals | Communication output |
| 9. Installation clip | Used for fixing the meter to the panel |

Table 2.1 Part name of MIC-2
Dimensions - unit: mm(inches)

Fig 2.2 Dimensions

## Environmental

Before installation, please check the environment, temperature and humidity to ensure the MIC-2 is being placed where optimum performance will occur.

## Temperature

Operation:
$-25^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$
Storage:

$$
-40^{\circ} \mathrm{C} \text { to } 85^{\circ} \mathrm{C}
$$

## Humidity

5\% to 95\% non-condensing.
The MIC-2 should be installed in a dry and dust free environment. Avoid exposing the unit to excessive heat, radiation and high electrical noise source.

## Installation steps

The MIC-2 can be installed into a standard ANSI C39.1 (4" round) or an IEC 92 mm DIN (square) form.

1. Cut a square hole or round hole on the panel of the switch gear.

The cutting size is shown in fig 2.3. - unit: mm (inches)

Fig 2.3 Panel cutting
2. Remove the clips from the unit, and insert it into the square hole from the front side.

Fig 2.4 Put the meter into the square hole
3. Put clips back into the unit from the backside and push the clips tightly so that the unit is fixed on the panel.

Fig 2.5 Use the clips to fix the unit on the panel

### 2.3.1 Terminal strips

There are four terminal strips at the back of the MIC-2 unit. The three phase voltage and current are represented by using 1,2 , and 3 respectively. These numbers have the same meaning as $A, B$, and $C$ or $R, S$, and $T$ used in other literature.

Current input terminal strip

Voltage input terminal strip

| V1 | V2 | V3 | VN |

Power supply terminal strip

Communication terminal strip

Fig 2-6. Terminal strips of the MIC-2

## Safety earth connection

Before setting up the MIC-2 wiring, please make sure that the switch gear has an earth ground terminal. Connect both the MIC-2's and the switch gear's ground terminals together. The following ground terminal symbol is used in this user's manual.

Fig 2-7 Safeth earth symbol

### 2.3.2 Power requirement

## Auxiliary power

$100 \sim 415 \mathrm{~V}$ AC $(50 / 60 \mathrm{~Hz})$ or $100-300 \mathrm{~V}$ DC.

## DANGEROUS

Only qualified personnel to do the wire connection work. Make sure the power supply is cut off and all the wires are powerless. Failure to observe this may result in severe injury or death.

NOTE
Make sure the voltage of power supply equals the auxiliary power required by the MIC-2. Make sure the auxiliary power terminal of the MIC-2 ground is connected to the safety earth of the switchgear.

The unit's typical power consumption is very low and can be supplied by an independent source or by the measured load line. A regulator or an uninterrupted power supply (UPS) should be used under high power fluctuation conditions. Terminals for the auxiliary power supply are 11, 12 and 13 ( $\mathrm{L}, \mathrm{N}$, and Ground). A switch or circuit breaker is to be included in a building installation. It must be located in close proximity to the equipment, within easy reach of the operator, and clearly marked as the disconnecting device for the equipment.

Fig 2-8 Power supply

A fuse (typical 1A/250V AC) should be used in auxiliary power supply loop. No. 13 terminal must be connected to the ground terminal of the switchgear. An isolated transformer or EMC filter should be used in the auxiliary power supply loop if there is a power quality problem in the power supply.

Fig 2-9 Power supply With EMC filter

Choice of wire of power supply could be AWG22-16 or 0.6-1.5 mm².

## Voltage input

Maximum input voltage for the MIC-2 shall not exceed 400LN/690LL V AC rms for three phase or 400LN V AC rms for single phase.
Potential Transformer (PT) must be used for high voltage systems. Typical secondary output for PTs equals 100 V or 120 V . Please make sure to select an approprate PT to maintain the measurement accuracy of the unit. When connecting using the star configuration wiring method, the PT's primary side rated voltage should be equal to or close to the phase voltage of the system to utilise the full range of the PT. When connecting using the delta configuration wiring method, the PT's primary side rated voltage should be equal to or close to the line voltage of the system. A fuse (typical 1A/250V AC) should be used in voltage input loop. The wire of voltage input could be AWG 16-12 or $1.3-2.0 \mathrm{~mm}^{2}$.

Note: Under no circumstance should the secondary of the PT be shorted. The secondary of PT should be grounded at one end. Please refer to the wiring diagram section for further details.

## Current input

Current Transformers (CTs) are required in most engineering applications. The typical current rating for the secondary side of the CT equals 5A. CTs must be used if the system rated current is over 5A. The accuracy of the CT should be better than $0.5 \%$ with rating over 3VA is recommended in order to preserve the unit's accuracy. Keep the wire between CTs and the MIC-2 as short as possible. The length of the wire may increase the risk of measurement errors.

The wire size of current input could be AWG $15-10$ or $1.5-2.5 \mathrm{~mm}^{2}$.
Note: The secondary side of the CT should not be an open circuit in any circumstance when the power is turned on. There should not be any fuse or switch in the CT loop. One end of the CT loop should be connected to the ground.

## Vn connection

Vn is the reference point of the MIC-2 voltage input. Low wire resistance helps improve the measurement accuracy. Different system wiring mode requires different V connection method. Please refer to the wiring diagram section for more details.

## Three-phase wiring diagram

The MIC-2 can be used for almost all kinds of three-phase wiring diagrams. Please read this section carefully before choosing the suitable wiring method for your power system.

### 2.3.3 Voltage input wiring

## 3-phase 4-line wye mode (3LN)

The 3-phase 4-line wye mode is popularly used in low voltage electric distribution power systems. For voltages lower than 400LN/690LL V AC, the power line can be connected directly to the unit's voltage input port as shown in fig 2.10a. For high voltage systems (over 400LN/690LL Vac), PTs are required and the connection method is shown in fig 2.10 b . The unit should be set to 3 LN for both voltage levels.

Fig 2.10a 3LN direct connection

Fig 2.10b 3LN with 3PT

## 3-phase 4-line 2PT mode (2LN*)

In a 3-phase 4-line wye system, 2PT wye mode is used when the 3-phase power system is balanced. The connection method is shown in fig 2.11 . The voltage of V 2 is calculated according to the V 1 and V 3 . The voltage input mode of the unit should be set to 2LN for the 2PT voltage input wiring mode.

Fig 2.11 2LN with 2PTs ( ${ }^{*}$ )

## 3-phase 3-line direct connection mode (3LL)

In a 3-phase 3-line system, power line L1, L2 and L3 are connected to V1, V2 and V3 directly. Vn is floated. The voltage input mode of the unit should be set to 3LL.

Fig 2.12 3LN 3-Phase 3-Line direct connection

## 3-phase 3 -line open delta mode (2LL)

Open delta wiring mode is often used in high voltage system. V2 and Vn are connected together in this mode. The voltage input mode of the unit should be set to 2LL for this voltage input wiring mode.

Fig 2.13 2LL with 2PTs

### 2.3.4 Current input wiring

3CT
The 3CT current wiring configuration can be used when either 3CTs are connected (as shown in Fig 2.14) or 2CTs are connected (as shown in Fig 2.15) to the system. In either case, there is current flowing through all three current terminals.

Fig 2.14 3CTs a

2CT
The difference between Fig 2.15 and Fig 2.16 is that no current flows through current input terminal 121 and $I 22$. The unit should be set to the 12 value which is calculated from formula $i 1+i 2+i 3=0$. The current input mode of the unit should be set to $2 C T$.

## 1CT*

If it is a three-phase balance system, 1 CT connection method can be used. The other two channels are calculated accordingly.

Fig 2.17 1CT (*)

### 2.3.5 Frequently used wiring method

In this section, most common voltage and current wiring connection combinations are put together into different diagrams. In order to display measurment readings correctly, please select the approprate wiring diagram according to your setup and application.

## 1. 3LN, 3CT with 3 CTs.

### 2.3 Wiring of the MIC-2

### 2.3.6 Communication

The MIC-2 uses RS485 serial communication and the Modbus-RTU protocol. The terminals of communication are A, B, and S (14, 15, 16). A is differential signal,$+ B$ is differential signal - and $S$ is connected to a shield of twisted pair cable. Up to 32 devices can be connnected on a RS485 bus. Use good quality shielded twisted pair cable, AWG22 $\left(0.5 \mathrm{~mm}^{2}\right)$ or higher. The overall length of the RS485 cable connecting all devices should not exceed 1200 m ( 4000 ft ). The unit is used as a slave device of masters like PC, PLC, data collector or RTU.

If the master does not have RS485 communication port, a converter (such as a RS232/RS485 or a USB/RS485 converter) will be required. Typical RS485 network topologies include line, circle and star (wye).The shield of each segment of the RS485 cable must be connected to the ground at one end only.

Every $\mathrm{A}(+)$ should be connected to $\mathrm{A}(+), \mathrm{B}(-)$ to $\mathrm{B}(-)$, or it will influence the network, or even damage the communication interface.
The connection topology should avoid "T" type which means there is a new branch and it does not begin from the beginning point.
Keep communication cables away from sources of electrical noise.
When several devices are connected to the same long communication an anti signal reflecting resistor (typical value 120 $2-300 \Omega / 0.25 \mathrm{~W}$ ) must be added to the end of the circuit beside the last MIC-2 unit.

Use a RS232/RS485 or USB/RS485 converter with optically isolated output and surge protection.

The human－machine interface of the unit will be described in this chapter．This includes viewing real－time metering data and setting parameters using different key combinations．

## 3．1 Display panel and keys

The front of the MIC－2 consists of a LCD screen and four control keys．All display segments are illustrated in fig 3．1．Users should note that all the segments will not display in a single page under normal operating conditions．

Fig3．1 All display segments

| SN | Display | Description |
| :---: | :---: | :---: |
| 1 | Display mode indication | Show different modes on the display area，＂Meter＂for real－time measurement；＂Max／ Min＂for statistic data；＂Demand＂for power demand data；＂Harmonic＂for harmonic data；＂Setting＂for parameters setting；＂Digital I／O＂for expended IO module data． |
| 2 | $\begin{aligned} & \text { Four lines of "㩊" digits in the metering } \\ & \text { area } \end{aligned}$ | Main display area：display metering data such as voltage，current，power，power factor， frequency，unbalance，phase angle，etc；display statistics such as maximum and minimum；display demand data；display settings and display expanded I／O data． |
| 3 | Four $\square$ ＂and five＂唖＂digits | Display energy data and real－time clock．Also used for the setting mode and digital I／O mode display． |
| 4 | Three＂䇥＂digits | Item icon：＂U＂for voltage；＂I＂for current；＂P＂for active power；＂Q＂for reactive power； ＂S＂for apparent power；＂PF＂for power factor；＂F＂for frequency；＂$\angle$＂for phase angles； ＂DMD＂for demand；display setting page number；display expanded IO module type for＂Mxx＂． |
| 5 | Unbalance，THD，TDD，MAX，MIN | Item icon：＂Unbalance＂for unbalance of the voltage and current；＂THD＂for total harmonics distortion；＂TDD＂for total demand distortion；＂MAX＂for maximum and ＂MIN＂for minimum |

| 17 | Time icon（1） | Time display in energy area |

There are four keys on the front panel，label as H，P，E and V／A from left to right．Use these four keys to read real－time metering data，set parameters and unit navigation．

Note：If the LCD backlight is off，pressing any key once will bring the backlight on（no other function will be performed upon the backlight activation key press）．

Pressing H and V/A simultaneously will activate the display mode selection and the cursor will flash. Press P or E to move the cursor right or left. To enter the metering mode, move the cursor to "Meter" then press V/A.

In the metering mode, the unit displays measurements such as voltage, current, power, power factor, phase angle, unbalance etc.

## a) Voltage and current:

Press V/A to read voltage and current in the metering area. The screen will roll to the next page everytime when V/A is pressed. It will go back to the first screen if you press $V / A$ at the last screen.

The following figure shows how it rolls:

Note: When the unit is set to " $2 L L$ " or " $3 L L$ ", there is no phase voltage and neutral current display. Therefore, only the third screen (line voltage \& avg) and the the fourth screen (three phase current \& avg) will be displayed.

## b) Power, power factor and frequency:

Press P, display power related data.
The screen will roll to the next page everytime when $P$ is pressed. It will go back to the first screen if you press $P$ at the last screen.
The following figure shows how it rolls:

Note: When the meter is set to "2LL" or "3LL", only the fifth screen (system power) and the sixth screen (system power factor \& frequency) will be displayed.

## c) Phase angles and unbalance:

Press H , display phase angles and unbalance data. The screen will roll to the next page everytime when H is pressed. It will go back to the first screen if you press H at the last screen.

The following figure shows how it rolls:

When using " $2 L L$ " or " $3 L L$ " wiring setting mode, voltage stands for line to line voltage. Otherwise, voltage stands for line-to-neutral voltage.

## d) Energy:

Press E key, display energy and real time clock. The screen will roll to the next page everytime when E is pressed. It will go back to the first screen if you press $E$ at the last screen.

The MIC-2 can be set to record primary power or secondary power. The unit of power is kWh for active power, kvarh for reactive power and kVAh for apparent power. The running time has a resolution of 0.01 h . It starts accumulating time right from the beginning when the unit is first powered on. The accumulated time is stored in the non-volatile memory. It can be reset via communication or from the meter front.

The following figure shows how it rolls:

Pressing H and V/A simultaneously will activate the display mode selection and the cursor will flash. Press P or E to move the cursor right or left. To enter the statistics data mode, scroll the cursor to "Max/Min" then press V/A.

In the statistics data mode, the unit displays the maximum values and minimum values for voltage, current, power, power factor, unbalance, demand, THD etc. Users should note that the time stamp for the parameters can be only viewed from the software through communication. No commands are associated with the key H in "Max/Min" display mode.

Press H , no functions.
Press P, screen will roll to the next page, and will roll back to the first screen when pressed at the last page.

Press E, screen will roll back to the previous page, and will roll back to the last screen when pressed at the first page.
Press $\mathrm{V} / \mathrm{A}$ to switch the view between maximum and minimum. For example, if the current display is the maximum phase voltage value, when $\mathrm{V} / \mathrm{A}$ is pressed, the display will show the minimum phase voltage value. If $\mathrm{V} / \mathrm{A}$ is pressed again, the display will switch back to show the maximum phase voltage value.

The following figure shows how it rolls:

Note:
i) The figure shows the rolling sequence when pressing $P$. The sequence will be reversed when pressing $E$.
ii) When the unit is set to " 2 LL " or " " LL ", the first screen(max value of phase voltage) will not be displayed.

Pressing H and V/A simultaneously will activate the display mode selection and the cursor will flash. Press P or E to move the cursor right or left. To enter demand mode, move the cursor to "Demand" then press $\mathrm{V} / \mathrm{A}$.

In the demand data mode, the first screen displays the demand of active power, reactive power and apparent power, and the second screen displays the current demand of phase L1, phase L2 and phase L3.

As shown in the figure, system active power demand is 3.285 kW , system reactive power demand is 0 kvar , system apparent power demand is 3.285 kVA.

Pressing H and V/A simultaneously will activate the display mode selection and the cursor will flash. Press P or E to move the cursor right or left. To enter harmonic mode, move the cursor to "Harmonic" then press V/A.

In the harmonic data mode, the unit displays the harmonic ratio of voltage and current, THD, odd HD, even HD, THFF, CF and KF.

## a) Power quality data:

Press H , display power quality data. It rolls to the next page when pressing H each time and rolls back to the first page when pressing H at the last page.

No commands are associated with the key P and E in "Hamonic" display mode.
Press V/A, switch to harmonic ratio data display.

## b) Harmonic ratio data

Press H , switch to power quality data display.

The harmonic order will increase by one when press P each time and will return to 2 nd when press P at the 31 st harmonic.
The harmonic order will decrease by one when pressing E each time and will return to the 31 st when pressing E at the 2 nd harmonic.

Press V/A, switch display between voltage harmonics and current harmonics.
The following figure shows how it rolls:

Note: The figure shows the rolling sequence when pressing key P. If press key E for rolling page, the sequence will reverse.

Pressing H and V/A simultaneously will activate the display mode selection and the cursor will flash. Press P or E to move the cursor right or left. To access data from the expanded I/O modules, move the cursor to "Digital I/O" then press V/A to enter the expanded I/O module data mode.

In the expanded I/O module data mode, the unit displays the data from expanded I/O modules, such as DI status, pulse counter number, relay status, analogue input, and analogue output etc.

In this mode, the first page is module selection. You can choose to view the available modules that are attached to the unit. If no expanded I/O modules are connected, the screen will display " NO IO".

## a) Module selection:

No commands are associated with the key H in the module selection screen.
Press P , move the cursor downwards, the cursor will move to the top when it reaches the bottom. If only one module is connected, pressing P will have no effect.

Press E, move the cursor upwards, the cursor will move to the bottom when it reaches the top. If only one module is connected, pressing E will have no effect.

Press V/A, select the module and enter the I/O module data selection mode.

As shown in the figure, three modules are connected, AXM-IO11, AXM-IO2 1, AXM-IO3 1, which are indicated by M11, M21, M31 respectively. The cursor points to M 21 , which indicates that $\mathrm{AXM}-\mathrm{IO} 21$ is chosen now.

## b) I/O Module data selection

Press H, return to module selection screen.
Press P, move the cursor downwards, the cursor will move to the top when it reaches the bottom. Please note that there are 3 parameters for AXMIO1, 3 parameters for AXM-IO2 and 4 parameters for AXM-IO3.

Press E, move the cursor upwards, the cursor will move to the bottom when it reaches the top.
Press V/A, select the parameter and enter the display of the data.

## c) $\mathbf{I} \mathbf{( 0}$ module data display

Press H , return to I/O module data selection screen.

The screen will roll to the next page each time when pressing $P$ and will return to the first page when pressing $P$ at the last page. If only one page exist, pressing P will have no effect.

The screen will roll to the last page each time when pressing E and will return to the last page when pressing E at the first page. If only one page exist, press E will have no effect.
No commands are associated with the key V/A in this display.
The following figure shows how it rolls:

Note: The figure shows the rolling sequence for using key P. If using E key for rolling page, the sequence will reverse.

Pressing H and V/A simultaneously will activate the display mode selection and the cursor will flash. Press P or E to move the cursor right or left. To enter the parameter setting mode, move the cursor to "Setting" then press V/A.

In the parameter setting mode, parameters, such as system parameters, expanded I/O module parameters, alarm parameters and Ethernet module parameters, can be read and modified.

## a) Password inquiry:

Parameter setting mode is password protected. Before entering the password and getting into the parameter setting mode, the unit's device communication address will display for 3 seconds. A four digit password ( 0000 to 9999 ) is required every time before accessing the parameter setting mode. The default password is 0000 . After entering the password, press $\mathrm{V} / \mathrm{A}$ to go to the parameter selection page. The unit will return to the metering mode if a wrong password is entered.

The following figure shows the password inquiry page.

To input password:
Press H , move the flashing cursor to the next position.
Press $P$, increase the number by 1 once a time.
Press E , decrease the number by 1 once a time.
Press V/A, confirm the password.

## b) Parameter selection mode

There are four parameters to choose from in the parameter selection manual: system, expanded I/O module, Ethernet module and alarm. No commands are associated with the key H in the parameter selection manual.
Press P, move the cursor downwards, the cursor will move to the top when it reaches the bottom.
Press E, move the cursor upwards, the cursor will move to the bottom when it reaches the top.
Press V/A, select and modify the parameter.

The figure shows the parameter selection page. "SYS" stands for system parameter, "I/O" stands for expanded I/O module parameter, "NET" stands for Ethernet module parameter and "ALM" stands for alarm parameter. As shown in the figure, the cursor points to the "SYS", which means system parameter is selected.

## c) System parameter setting

Users can select and modify system parameters in the system parameter setting mode.

## Key functions for modifying the parameter:

Press H , move the flashing cursor to the next position. Press P , increase the number by 1 once a time. Press $E$, decrease the number by 1 once a time. Press V/A, confirm the modification and return to parameter selection mode.

The following figure shows how it rolls:

Note: The figure shows the rolling sequence for using key P. If using E key for rolling page, the sequence will reverse.

## d) Expanded I/O module parameter

In the expanded I/O module parameter mode, users can choose to view and modify the available unit modules parameters. If no expanded I/O modules are connected, the screen will display "NO IO". To return to the system parameter setting mode main menu, press H (no commands are associated with other keys in this screen).

## Key functions for $\mathbf{I} / \mathbf{0}$ module selection:

Press H, return to parameter selection mode.
Press P , move the cursor downwards, the cursor will move to the top when it reaches the bottom. If there is only one module connected, pressing $P$ will have no effect.
Press E, move the cursor upwards, the cursor will move to the bottom when it reaches the top.
If there is only one module connected, pressing E will have no effect.
Press $\mathrm{V} / \mathrm{A}$, select the module and enter the $\mathrm{I} / \mathrm{O}$ module parameter setting mode.

## Key functions for setting the I/O module parameter:

Press H, return to I/O module selection mode.
The screen will roll to the next page each time when pressing $P$ and will return to the first page when pressing $P$ at the last page.
The screen will roll to the last page each time when pressing $E$ and will return to the last page when pressing $E$ at the first page.
Press V/A, modify the selected parameter.

## Key functions for modifying the parameter:

Press H , move the flashing cursor to the next position.
Press $P$, increase the number by 1 once a time.
Press $E$, decrease the number by 1 once a time.
Press V/A, confirm the modification and return to parameter selection mode.
The following table shows how it rolls:

DI of AXM-IO1 can be used as the pulse counter, each D function corresponds to one bit of a 6-bit register. The correspondence bit of 0 means that the DI works as the digital status input and the
correspondence bit of 1 means that the DI works as the pulse counter For example, if the setting value is 000001 , it means that DI1 is set as the pulse counter and other DIs work as digital status inputs.

If the DI works as a pulse counter, when the number of pulses counted by the DI equals to the pulse constant, the pulse counter will increment by one. This means that the actual pulse number equals the number of pulse counter times the pulse constant

Relays of AXM-IO1 can be used as alarm output or control output. ALM:alarm output; CTRL:control output

When set as control output, relays have two control methods: latch or pulse. LATCH: latch mode; PUL: pulse mode

If relay pulse control method is selected, the relay contact will close for a preset period and open afterwards. The pulse width range is $50 \sim 3000 \mathrm{~ms}$.

DI of AXM-IO2 can be used as the pulse counter, each DI function corresponds to one bit of a 4-bit register. The correspondence bit of 0 means that the DI works as the digital status input and the correspondence bit of 1 means that the DI works as the pulse counter. For example, if the setting value is 0001 , it means that DII is set as the pulse counter and other Dls work as digital status inputs.
If the DI works as a pulse counter, when the number of pulses counted by the DI equals to the pulse constant, the pulse counter will increment by one. This means that the actual pulse number equals the number of pulse counter times the pulse constant.
DO of AXM-IO 1 can be used as either alarm output or energy pulse output. ALM: alarm output; PUL: energy pulse output.

Range from 20-1000 ms.
Choose output energy type for DO1. Range from 0-4. 0: no output; 1: import active energy; 2: export active power; 3: import reactive energy; 4: export reactive energy.

Follow the DO1 setup method to setup DO2.
If DO type is set as alarm output, DO1 and DO2 output type parameters will have no effect.
Range from 0 to 3, 0: 0-20 mA; 1: 4~20 mA; 2: 0-5V; 3: 1-5V.
Be aware that modules with current option cannot be set as voltage type (i.e. option 2 and 3 are unavailable); modules with voltage option cannot be set as current type (i.e. option 0 and 1 are unavailable).

For AO 1 and AO 2 transforming parameter:
Range: 0~29, see Chapter 5 "AO transforming parameter settings" in the I/O manual for more details.
DI of AXM-IO3 can be used as the pulse counter, each DI function corresponds to one bit of a 4-bit register. The correspondence bit of 0 means that the DI works as the digital status input and the correspondence bit of 1 means that the DI works as the pulse counter. For example, if the setting value is 0001 , it means that DI 1 is set as the pulse counter and other DIs work as digital status inputs.
If the DI works as a pulse counter, when the number of pulses counted by the DI equals to the pulse constant, the pulse counter will increment by one. This means that the actual pulse number equals the number of pulse counter times the pulse constant.
When set as control output, relays have two control methods: latch or pulse
Relays of AXM-IO3 can be used as alarm output or control output. ALM:alarm output; CTRL:control output
If relay pulse control method is selected, the relay contact will close for a preset period and open afterwards. The pulse width range is $50 \sim 3000 \mathrm{~ms}$.
Range from 0 to 3. 0: 0~20mA; 1: 4~20mA; 2: 0~5V; 3: 1~5V.
Be aware that modules with current option cannot be set as voltage type (i.e. option 2 and 3 are unavailable); modules with voltage option cannot be set as current type (i.e. option 0 and 1 are unavailable).

Note: The figure shows the rolling sequence for using key P. If using E key for rolling page, the sequence will reverse.

## e) Ethernet module parameter

In the Ethernet module parameter mode, users can view and modify the parameters. If no Ethernet module is connected, settings will have no effect.

## Key functions for finding the Ethernet module parameter:

Press H, return to parameter selection mode.
The screen will roll to the next page each time when press P and will return to the first page when press P at the last page. The screen will roll to the last page each time when press E and will return to the last page when press E at the first page.
Press V/A, modify the selected parameter.

## Key functions for modifying the parameter:

Press H , move the flashing cursor to the next position.
Press $P$, increase the number by 1 once a time.
Press $E$, decrease the number by 1 once a time.
Press V/A, confirm the modification and return to parameter selection mode.
The following figure shows how it rolls:

The selection of DHCP setting: MANU or AUTO
Default setting: MANU
IP address have four segments. Any segment can be set from 0~255.
Default setting: 192.168.1.254
Submask have four segments. Any segment can be set from 0~255.
Default setting: 255.255.255.0
Gateway have four segments. Any segment can be set from 0~255.
Default setting: 192.168.1.1
DNS1 have four segments. Any segment can be set from 0~255.
Default setting: 202.106.0.20
DNS2 have four segments. Any segment can be set from 0~255.
Default setting: 0.0.0.0
Range from 2000-5999, the default value is 502

Range from 6000-9999, the default value is 80
0 : No resetting; 1: Reset module after modifying parameters; 2 : Reset module to default values

Note: The figure shows the rolling sequence for using key P. If using E key for rolling page, the sequence will reverse.

## f) Alarm parameter

In the alarm parameter mode, users can view and modify the parameters.

## Key functions for finding the alarm parameter:

Press H , return to parameter selection mode.
The screen will roll to the next page each time when press P and will return to the first page when press P at the last page. The screen will roll to the last page each time when press E and will return to the last page when press E at the first page. Press V/A, modify the selected parameter.

## Key functions for modifying the parameter:

Press H , move the flashing cursor to the next position.
Press $P$, increase the number by 1 once a time.
Press $E$, decrease the number by 1 once a time.
Press V/A, confirm the modification and return to parameter selection mode.
The following figure shows how it rolls:

Yes: Alarm enable; No: Alarm disable
It can be selected as cue signal for alarming.
Yes: backlight flashes upon alarm condition; No: No backlight flashing
There are 16 alarm channels available. Each channel is controlled and enabled 1 bit each from a 16 -bit register. Bit value of 1 means that the corresponding alarm channel is enabled whereas 0 means that the channel is disabled. The meter will display the value of this 16 -bit register in decimal numbers (for different channel combination). For example, 00000 means that all channels are disabled; 00001 means only the first channel is enabled; 65535 means that all channels are enabled. Refer to section 4.4 on page 65 for more details.
"AND" logic relationship can be set among channels. When an "AND" logic is in place, both channels have to be triggered before the meter sends out the alarm signal. The logic can be set according to the predefined rule (refer to section 4.4 for more details). Users can setup up to 8 logic relationships for alarming. Each logic relationship is controlled and enabled 1 bit each from a 16 -bit register (only the lower 8 bits are used). Bit value of 1 means that the corresponding logic relationship is enabled whereas 0 means that the relationship is disabled. The meter will display this 8 -bit value in decimal numbers (for different relationship combination). For example, 000 means that all relationships are disabled; 001 means only the first relationship is enabled; 255 means that all relationships are enabled.
When DO1 works in alarming mode, a 16-bit register is used to controlled which channels are associated with this output. Similar to alarm channels selection, this 16-bit value is expressed in decimal when reading on the meter front. For example, 00000 means that no alarm channels are associated to this output; 00001 means that alarm channel 1 is associated to DO1; 65535 means that all alarm channels are associated to DO1. Refer to section 4.4 for more details.
If 2 AXM-IO2 modules are attached to the meter, DO 1 and DO 2 denote to the first and the second DO channel of AXM-IO21; DO3 and DO4 denote to the first and the second DO channel of AXMIO22 respectively. DO2, DO3 and DO4 use the same setup method as DOI.

Note: The figure shows the rolling sequence for using key P. If using E for rolling page, the sequence will reverse.

The MIC-2 has a page recovery function. This means that the unit stores current display page in the non-volatile memory upon power loss and reloads the page when power recovers. If power goes off when viewing under the parameter setting mode, the unit will show voltage display when power recovers. If power goes off when viewing under the expanded I/O module data mode, and if this expanded I/O module is not connected when power recovers, the unit will show the voltage display page instead.

The MIC－2 contains very advanced metering tools and is able to measure almost all power metering and quality parameters from a power system． Some advanced functions may not be accessible directly from the unit front；therefore，every unit comes with a powerful software that helps accessing those information．This chapter is dedicated to introduce these functions and the software．
4．1 Basic Analogue Measurements
The MIC－2 can measure voltage，current，power，frequency，power factor and demand etc．with high accuracy，shown as below：

|  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Tart Readngs Settings tep |  |  |  |  |  |

Fig 4．1 Real－time metering

## Demand：

The MIC－2 consists of several types of demand calculation：total active power demand，total reactive power demand，total apparent power demand， phase L1 current demand，phase L2 current demand，and phase L3 current demand．When demand is reset，demand memory registers are set as 0 ．

Demand calculating mode can be set as sliding window and thermal by the user．The figure 4－7 shows how it works．
When using the sliding window interval method，the user selects an interval from 1 to 30 minutes，which is the period of the calculation．The demand updates every 1 minute．

Thermal demand method calculates the demand based on a thermal response which mimics the thermal demand meter．The user selects the period for the calculation and the demand updates at the end of each period．

## Energy：

MIC－2 series meter measures and accumulates energy in different directions（import and export）．For real－time energy monitoring，it accumulates energy for kWh，kvarh and kVAh continuous（since its last reset）．

## Calculating mode：

1．The user can select different energy calculating modes，fundamental based or full－wave based either from the unit front or via communication．
Fundamental based calculating is to accumulate energy without taking harmonics into consideration while full－wave based calculating is to accumulate energy including fundamental and harmonics．
Note：When fundamental based calculating mode is selected，PF calcuation will be based on the fundamental wave．
2．There are two ways to calculate reactive energy（power）
Mode 0 ：real reactive energy $Q-\sqrt{S^{2}-P^{2}-D^{2}}$
Mode 1：general reactive energy $Q-\sqrt{S^{2}-P^{2}}$
3．User can choose primary energy or secondary energy either by pressing keys from the meter front or via communication as shown in figure 4－7．

Figure 4-2 Energy and Power quality parameters

## Current direction adjustment

Under normal circumstances, current flows from input terminal 1 to terminal 2 (i.e. from I 11 to II 2 for phase L1 current); however, current may flow in the opposite direction due to wrong wiring setup. Instead of rewiring the system, the MIC-2 provides the user with an option to reverse the polarity of the current. By default, the current direction is set as "positive", to reverse the current polarity by 180 degrees, the user can set current direction as "negative". Refer to Fig 4.7 for more details.

Figure 4-3 Max/Min
The MIC-2 logs maximum and minimum value statistics for phase/line voltages, currents, power, reactive power, apparent power, power factor, frequency, demand, unbalance factor, THD as well as the time they occur. All data is stored in a non-volatile memory so that statistic information can be preserved even when the unit is shut off. All maximum and minimum data can be accessed via communication or from the unit front but time stamps can only be accessed via communication. Statistics can be cleared via communication or from the unit front.

## 1. Harmonics

The MIC-2 can measure and analyse THD, harmonics (2nd to 31 st for MIC-2), even HD, odd HD, crest factor, THFF, K factor, etc. They are shown in figure 4-2.

## 2. Phase angle:

Phase angle indicates the angle between phase A voltage and other voltage/current parameters. Angle ranges from 0 to 360 degrees. This function is to help user to find out the relationship between all input signals avoiding wrong wiring. When it is set to " 2 LL " or " 3 LL ", it gives out the phase angles of $u 23, i 1, i 2$, $i 3$ corresponding to $u 12$. For other settings, it gives out the phase angles of $u 2, u 3, i 1, i 2$, $i 3$ corresponding to $u 1$. They are shown in figure 4-4.

## 3. Sequence component and unbalance analysis

The MIC-2 is able to perform sequential analysis for the input signal. It looks at the positive sequence, negative sequence and zero sequence of the fundamental frequency and performs unbalance analysis for voltage and current. Sequence components are shown in figure 4-4, unbalance of voltage and current are shown in figure 4-1.

Figure 4-4 Sequence component and phase angle

The MIC-2 has over/under limit alarming capability. When the monitored parameter goes over/under the preset limit and stays at the level over the preset amount of time delay, the over/under limit alarm will be triggered. The over/under limit value and its time stamp will be recorded in the alarming log. The meter can record up to 16 alarming records. When extended I/O modules are attached, digital outputs (DO) and relay outputs (RO) can be triggered upon alarm conditions and used to activate downstream devices such as beacon light and buzzer.
Before using the alarming function, alarm conditions such as logic dependency, target setpoint, time delay, etc. must be set correctly. Settings can be accessed and modified from the software via communication connection as shown in Fig 4-5.

Figure 4-5 Alarm setting

## 1. Single alarming group setting

Table 4-1 indicates the first group of settings, there are 16 groups in total with the same format.

| Address | Parameter | Range | Property |
| :--- | :--- | :--- | :--- |
| 104 eH | First group: parameter code | $0 \sim 50$ | R/W |
| 104 fH | First group: comparison mode | $1:$ :larger,2:equal,3:smaller | R/W |
| 1050 H | First group: setpoint value | Related with parameters | R/W |
| 1051 H | First group: delay time | $0 \sim 3000$ (*10ms) | R/W |
| 1052 H | First group: output to relay | $0:$ none,1-8:related relay | R/W |

Table 4-1 First group of alarming settings
Parameter code: select target parameter for alarm monitoring For example: 0-frequency, 44-Al4 sampling data.
Comparison mode: set alarming condition 1: greater than, 2 : equal to, 3 : smaller than. For example: if you choose target parameter to be "frequency", condition to be "greater than" and setpoint to be " 50 ", alarm will be triggered when the frequency is greater than 50 Hz .
Note: setpoint value is the same as the actual value of the selected parameter.
Delay time: If the alarms condition lasts for the preset time period, the alarm signal will be triggered. The delay range is from 0 to 3000 (unit: 10 ms ).
When it is set to 0 , there is no delay, alarm will be triggered when the alarm condition is met. If it is set to 20 , there will be a 200 ms ( $20 \times 10 \mathrm{~ms}$ ) delay.

Output to relay: 0 -alarming signal will not be sent to RO; if it is set as 1 and AXM-IO1 is connected, it will output to RO1 when alarm triggers. RO1 will be turned off when all alarms output to RO1 are cleared. RO2~RO8 work in the same manner as RO1.

Note: If RO is under alarming mode, it can only work in "latch" mode.
After setting up the alarming parameters, the user must also setup the global settings in order for the alarm to work properly.

## 2. Global settings

Register addresses for global alarm settings are from 1046H~104dH.Please refer to section 5.3 "Global alarming settings" for more details.
"Global alarming enable" determines whether the alarming function of the meter is activated or not. The alarming function is enabled when it is set as "1".

When "Alarming flash enable" is set as " 1 ", backlight will flash when alarm is triggered.
"Alarming channel enable setting" determines whether the corresponding alarm group is enabled or not. There are 16 groups in all and each one is corresponding to one bit of a 16-bit register. The corresponding bit must be set to " 1 " in order to activate the alarm channel.
"Logical "AND" between alarming setting": The 16 alarming records in MIC-2 are divided into 8 pairs. Each pair has two alarm groups. The two groups can be logically "AND" by controlling the logic check box. When two groups are "AND", alarming triggers only if both AND conditions are met. If the "AND" logic box is unchecked, the two alarm channels will work independently.

The 8 "AND" logic pairs are arranged as follows: 1st,2nd channel form Pair 1; 3rd,4th channel form Pair 2; 5th,6th channel form Pair 3; 7th,8th channel form Pair 4; 9rd, 10th channel form Pair 5; 1 1th,12th channel form Pair 6; 13th, 14th channel form Pair 7; 15th, 16th channel form Pair 8.

This function is controlled by the lower 8 bits of 16 bits register, each bit is corresponding to a pair. " 1 " means this function is enabled and " 0 " means disabled.
"Alarming output to DO 1 setting": When "Digital output mode" is set to " 1 ", DO1 can be used as alarming output. A 16-bit register is used to perform this function, its bit0~bit 15 correspond to the 1 st $\sim 16$ th group respectively. When the related I/O module is connected and is under alarming mode, and if the corresponding bit is set to 1 and the alarming condition is met, alarm signal will be sent to DO1. DO1 will be turned off when all alarms correspond to DO1 are cleared. If related bit is set to 0 , that alarm channel will not issue alarm signal to DO 1. DO2~DO4 work in the same manner DO1.

After completing the setup steps correctly, the alarming function can be used.

## 3. Setting Eeample

Here is an example of showing how to apply the logical "AND" function for a pair of alarm channels.

The conditions are as follows: 11 greater than 180A, delay 5 s for the 1 st alarm channel; U1 less than 9980V, delay 10 s for the 2 nd alarm channel. No alarm signals will be sent to outputs. The CT primary value of I 1 is 200A, and CT2 is 5A. The PT ratio for U 1 is 10000 : 100 . The following shows how all the related registers are to be set.

## Settings of first group:

"Parameter code $(104 \mathrm{eH})$ " is set to 9 , which stands for 11 .
"Comparison mode $(104 \mathrm{fH})$ " is set to 1 , which stands for "greater than".
"Setpoint value $(1050 H)$ " is set to 4500 , according to the relationship between actual value and communication value ( $\mathrm{I}=\mathrm{Rx} *(\mathrm{CT} 1 / \mathrm{CT} 2$ ) /1000). "Delay time $(1051 \mathrm{H})$ " is set to 500 , so the actual delay time is $500 * 10 \mathrm{~ms}=5 \mathrm{~s}$.
"Output to relay $(1052 \mathrm{H})$ " is set to 0 , because there is no output to RO.

## Settings of second group:

"Parameter code $(1053 H)$ " is set to 1 , which stands for $U 1$.
"Comparison mode $(1054 \mathrm{H})$ " is set to 3 , which stands for "smaller than".
"Setpoint value $(1055 H)$ " is set to 998 , according to the relationship between actual value and communication value ( $\mathrm{U}=\mathrm{Rx} \mathrm{X}(\mathrm{PT} 1 / \mathrm{PT} 2) / 10)$.
"Delay time $(1056 \mathrm{H})$ " is set to 1000 , so the actual delay time is $1000^{*} 10 \mathrm{~ms}=10 \mathrm{~s}$.
"Output to relay $(1057 \mathrm{H})$ " is set to 0 , because there is no output to RO.

## Global settings:

"Alarming channel enable setting $(1048 \mathrm{H})$ " set to 0003 H to enable the first and the second channel. "Logical "AND" between alarming setting $(1049 H)$ " set to 0001 H to enable logic "AND" in Pair 1.
"Alarming output to DO1 setting (104aH)" set to 0 , since no output to DO1.
"Alarming output to DO2 setting (104bH)" set to 0 .
"Alarming output to DO3 setting $(104 \mathrm{cH})$ " set to 0 .
"Alarming output to DO4 setting (104dH)" set to 0 .
"Alarming flash enable $(1047 \mathrm{H})$ " set to 0 to disable backlight flashing when alarming occurred.
"Global alarming enable $(1046 \mathrm{H})$ " set to 1 to enable over/under limit alarming.

## 4. Records of alarming event

The MIC-2 has built in alarm logging capability. There are 16 record entries in total. The record sequence of these entries do not depend on the sequence of the 16 alarm channels. The unit begins logging alarm status starting from the 1 st record location to the last one. Alarm logs are being recorded in a "cycle" fashion which means the latest event will overwrite the oldest record. When over/under limit parameters return to normal, its value and time stamp will be recorded as well. Therefore, users can determine the over/under limit duration by checking the time difference. Here is the 1st group of record. Other groups of records have the same format.

| Address | Parameter | Range |
| :--- | :--- | :--- |
| 42 a 9 H | First group: alarming status | $0 \sim 65535$ |
| 42 aaH | First group: parameter code | $0 \sim 50$ |
| 42 abH | First group: over/under limit or reset value | Related with parameters |
| $42 \mathrm{acH} \sim 42 \mathrm{~b} 2 \mathrm{H}$ | First group: occur time: yyyy:mm:dd:hh:mm:ss:ms | Time |

Table 4-2 Alarming status of the 1 st group of record
"Alarming status" indicates information of current alarm status. It is a 16-bit unsigned integer. Parameter code is stored in the higher 8 bits. Bit 1 indicates whether logic "AND" is enabled or not, 1 means enabled and 0 means not. BitO indicates whether alarming is occurred or recovered, 1 means occurred and 0 means recovered. Undefined bits are 0.
"Parameter code" specifies the monitored parameter.
"Value" shows the recorded value of the selected parameter when alarm triggers and when it recovers.
"Time" indicates the time stamp with the accuracy of in milliseconds (ms).

Alarming event will set bit0 of "system status (102eH)" to be 1 . At the same time, corresponding flags will be set to 1 to indicate new data. The flag will be cleared after the data is read. Bit0 of "system status $(102 \mathrm{eH})$ " will be set to 0 .

Note: Although no alarming records will be lost during unit power off, alarm status will start recording from the 1st alarm log entry when the unit is powered on again.

Here is an example:

Fig 4-6 Alarming records

Figure 4-7 basic settings

Software with data logging is available for software download on www.deif.com under "Download centre" > "Software download".

This chapter will mainly discuss how to handle the unit via the communication port using software. To master this chapter, you should be familiar with Modbus and have read other chapters of this manual, and you a good understanding of the functions and applications of this product. This chapter includes: Modbus protocol, format of communication and data address table and MIC-2 application details.

### 5.1 Modbus protocol introduction

ModbusTM RTU protocol is used for communication in MIC-2. Data format and error check methods are defined in Modbus protocol. The half duplex query and respond mode is adopted in Modbus protocol. There is only one master device in the communication net. The others are slave devices, waiting for the query of the master.

## Transmission mode

The mode of transmission defines the data structure within a frame and the rules used to transmit data. The mode is defined in the following which is compatible with Modbus RTU Mode*.
Framing

| Coding System | 8-bit binary |  |
| :--- | :--- | :--- |
| Start bit | 1 |  |
| Data bits | 8 |  |
| Parity | no parity |  |
| Stop bit | 1 |  |
| Error checking | CRC check |  |
|  |  | Data |
| Address | Function | N $\times 8$-Bits |
| 8-Bits | 8-Bits |  |

Table 5.1 Data frame format
Address field
The address field of a message frame contains eight bits. Valid slave device addresses are in the range of $0 \sim 247$ decimal. A master addresses a slave by placing the slave address in the address field of the message. When the slave sends its response, it places its own address in this address field of the response to let the master know which slave is responding.

## Function field

The function code field of a message frame contains eight bits. Valid codes are in the range of $1 \sim 255$ decimal. When a message is sent from a master to a slave device the function code field tells the slave what kind of action to perform.

| Code | Meaning | Action |
| :--- | :--- | :--- |
| 01 | Read Relay Output Status | Obtain current status of Relay Output |
| 02 | Read Digital Input(DI) Status | Obtain current status of Digital Input |
| 03 | Read Data | Obtain current binary value from one or more registers |
| 05 | Control Relay Output | Force relay state to "ON" or "OFF" |
| 16 | Press Multiple-Register | Place specific binary values into a series of consecutive Multiple-Registers |

[^0]
## Data Field

The data field is constructed using sets of two hexadecimal digits, in the range of 00 to FF hexadecimal. The data field of messages sent from a master to slave devices contains additional information which the slave must use to take the action defined by the function code. This can include items like discrete and register addresses, the quantity of items to be handled, and the count of actual data bytes in the field. For example, if the master requests a slave to read a group of holding registers (function code 03), the data field specifies the starting register and how many registers are to be read. If the master writes to a group of registers in the slave (function code 10 hexadecimal), the data field specifies the starting register, how many registers to write, the count of data bytes to follow in the data field, and the data to be written into the registers.

If no error occurs, the data field of a response from a slave to a master contains the data requested. If an error occurs, the field contains an exception code that the master application can use to determine the next action to be taken. The data field can be nonexistent (of zero length) in certain kinds of messages.

## Error check field

Every message includes an error checking field which is based on the Cyclical Redundancy Check (CRC) method. The CRC field checks the contents of the entire message. It is applied regardless of any parity check method used for the individual characters of the message. The CRC field is two bytes long, containing a 16 -bit binary value. The CRC value is calculated by the transmitting device, and is appended to the message.

The receiving device recalculates the CRC value during reception of the message, and compares the calculated value to the actual value it received in the CRC field. If the two values are not equal, an error will be reported. CRC calculation is first started by preloading the whole 16 -bit register to 1 's. The process begins by applying successive 8-bit bytes of the message to the current contents of the register. Only the eight bits of data in each character are used for generating the CRC. Start and stop bits, and the parity bit, do not apply to the CRC. When generating the CRC, each 8-bit character is exclusive ORed with the register contents. The result is shifted towards the least significant bit (LSB), with a zero filled into the most significant bit (MSB) position. The LSB is extracted and examined, if the LSB equals to 1 , the register is exclusive ORed with a preset, fixed value; if the LSB equals to 0, no action will be taken. This process is repeated until eight shifts have been performed. After the last (eighth) shift, the next 8 -bit byte is exclusive ORed with the register's current value, and the process repeats for eight more shifts as described above. The final contents of the register, after all the bytes of the message have been applied, is the CRC value. When the CRC is appended to the message, the low-order byte is appended first, followed by the high-order byte.

Explanation of frame

| Addr | Fun | Data start reg HI | Data start reg LO | Data \#of regs HI | Data \#of regs $L 0$ | CRC 16 HI | $\begin{aligned} & \text { CRC } 16 \\ & \text { LO } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 06H | 03H | OOH | OOH | OOH | 21 H | 84H | 65 H |

Table 5.3 Explanation of frame

The meaning of each abbreviated word is,
Addr: Address of slave device
Fun: Function code
Data start reg HI: Start register address high byte
Data start reg LO: Start register address low byte
Data \#of reg HI: Number of register high byte
Data \#of reg LO: Number of register low byte
CRC16 HI: CRC high byte
CRC16 LO: CRC low byte

## 1. Read status of relay

Function Code 01
This function code is used to read status of relay in the MIC-2.
1=On 0=Off
Relay1's address is $0000 H$, Relay2's address is 0001 H , and so on.

The following query is to read the relay status for the meter with communication address 17.
Query

| Addr | Fun | Relay start reg HI | Relay start reg LO | Relay \#of regs HI | Relay \#of regs LO | CRC 16 <br> HI | $\begin{aligned} & \text { CRC } 16 \\ & \text { LO } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11 H | 01 H | OOH | OOH | OOH | O2H | BFH | 5BH |

Table 5.4 Read the status of Relay 1 and Relay2 Query Message

## Response

The MIC-2 response includes the MIC-2 address, function code, quantity of data byte, the data, and error checking. An example response to read the status of Relay 1 and Relay 2 is shown as Table 5.5. The status of Relay 1 and Relay 2 are responding to the last 2 bits of the data.
Relay1: bitO Relay2: bit1

| Address | Function code | Byte count | Data | CRC high | CRC low |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 11 H | 01 H | 01 H | 02 H | D 4 H | 89 H |

Table 5.5 Relay status responds

The content of the data is:

| MSB |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 |
| 0 | 0 | 0 | 0 | 0 | 0 | LSB |

Relay $1=$ OFF (LSB ), Relay2=ON (Left to LSB )

## 2. Read status of DI

Function Code 02
1=On O=Off
DII's address is $0000 \mathrm{H}, \mathrm{DI} 2$ 's address is 0001 H , and so on.
The following query is to read the status of 4 DIs of MIC-2 with communication address 17.

Query

| Addr | Fun | DI start addr HI | DI start addr LO | DI num HI | DI num 10 | CRC 16 <br> HI | $\begin{aligned} & \text { CRC } 16 \\ & \text { LO } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11 H | 02H | OOH | OOH | OOH | 04H | 7BH | 59 H |

[^1]
## Response

The MIC-2 response includes the MIC-2 address, function code, quantity of data characters, the data characters, and error checking. An example response to read the status of 4 DIs is shown in Table in 5.7. The DI status corresponds to the last 4 bits of the data.
DI1: bit0; DI2: bit1; DI3: bit2; DI4: bit3.

| Address | Function code | Byte count | Data | CRC high | CRC low |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 11 H | 02 H | 01 H | 03 H | E 5 H | 49 H |

Table 5.7 Read status of DI

The content of the data is:

| MSB |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 |
| 0 | 0 | 0 | 0 | 0 | 0 | 1 |

$\mathrm{DI} 1=\mathrm{On}, \mathrm{DI} 2=\mathrm{On}, \mathrm{DI} 3=\mathrm{Off}, \mathrm{DI} 4=\mathrm{Off}$.

## 3. Read data (Function Code 03)

## Query

This function allows the master to obtain the measurement results from the MIC-2. Table 5.8 is an example to read the 3 measured data ( $F$, V1 and V2) from slave device number 17 , the data address of F is $4000 \mathrm{H}, 4001 \mathrm{H} ; \mathrm{V}$ ' 's address is $4002 \mathrm{H}, 4003$, and V ' s address is $4004 \mathrm{H}, 4005 \mathrm{H}$.

| Addr | Fun | Data start addr HI | Data start addr LO | Data \#of regs HI | Data \#of regs LO | CRC 16 regs HI | CRC 16 regs LO |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11 H | 03H | 40 H | OOH | OOH | 06H | D2H | 98 H |

Table 5.8 Read F, V1, V2 query message

## Response

The MIC-2 response includes the MIC-2 address, function code, quantity of data byte, data, and error checking. An example response to read F, V1 and $\mathrm{V} 2(\mathrm{~F}=42480000 \mathrm{H}(50.00 \mathrm{~Hz}), \mathrm{V} 1=42 \mathrm{C} 7 \mathrm{CCCDH}(99.9 \mathrm{~V}), \mathrm{V} 2=42 \mathrm{C} 83333 \mathrm{H}(100.1 \mathrm{~V}))$ is shown:

| Addr | Fun | Byte count | Datal HI | Datal L0 | Data 2 HI | Data2 $L 0$ | Data3 HI | Data3 LO | Data4 HI | Data4 $L 0$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11 H | 3 H | OCH | 42 H | 48H | OOH | OOH | 42 H | C 7 H | CCH | CDH |

| Data5 HI | Data5 L0 | Data 6 HI | Data6 LO | CRC16 HI | CRC16 LO |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 42 H | C 8 H | 33 H | 33 H | CAH | 7 FH |

Table 5.9 Read F, V1 and V2 message

## 4. Control relay (Function Code 05)

## Query

This message forces a relay to either turn "ON" or "OFF". Any relay that exists within the MIC-2 can be forced to either "ON" or "OFF" status. The data value FFOOH will set the relay on and the value 0000 H will turn it off; all other values are illegal and will not affect that relay.
The example below is a request to the MIC-2 with the address of 17 to turn on Relay 1.

| Addr | Fun | DO addr HI | DO addr LO | Value HI | Value LO | CRC 16 HI | CRC 16 LO |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11 H | 05H | OOH | OOH | FFH | OOH | 8EH | AAH |

Table5.10 Control relay query message

## Response

The normal response to the command request is to retransmit the message as received after the relay status has been altered.

| Addr | Fun | Relay addr HI | Relay addr Lo | Value HI | Value LO | CRC HI | CRC LO |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11 H | 05H | OOH | OOH | FFH | OOH | 8EH | AAH |

[^2]
## 5. Preset/Reset multi-register (Function Code 16)

## Query

Function 16 allows the user to modify the contents of a multi-register. Some registers of the MIC-2 can have their contents changed by this message. The example below is a request to an MIC-2 with the address of 17 to preset Ep_imp as " $17807783.3 \mathrm{KWh"}$ " while its HEX value is OA9D4089H.
Ep_imp data address is 4048H and 4049H.

| Addr | Fun | Data start <br> reg HI | Data start <br> reg Lo | Data \#of <br> reg HI | Data \#of <br> reg Lo | Byte Count |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11 H | 10 H | 40 H | 48 H | 00 H | 02 H | 04 H |

| Value HI | Value LO | Value HI | Value LO | CRC HI | CRC LO |
| :---: | :---: | :---: | :---: | :---: | :---: |
| OAH | $9 D H$ | $40 H$ | $89 H$ | F1H | $6 A H$ |

Table5.12 Preset multi-register query message

## Response

The normal response to a preset multi-register request includes the MIC-2 address, function code, data start register, the number of registers, and error checking.

| Addr | Fun | Data start reg hi | Data start reg lo | Data \#of reg hi | Data \#of Reg lo | CRC16 <br> hi | CRC16 <br> lo |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11 H | 10 H | 40 H | 48 H | OOH | 02H | D6H | 8EH |

[^3]
### 5.3 Data address table and application details

MIC-2

There are several rules to follow in using the unit:

## 1. Data type:

"bit" refers to binary.
"word" refers to 16-bit unsigned integer using one data address and 2 bytes of memory, it varies from 0 to 65535 .
"int" refers to 16 -bit integer using one data address and 2 bytes of memory, it varies from - 32768 to32767.
"dword" refers to 32 -bit unsigned integer using two data addresses and 4 bytes of memory with high word at the front and low word at the end, it varies from 0 to 4294967295 . Rx=high word *65536+low word.
"float" refers to 32 -bit single value using two data addresses and 4 bytes of memory, it varies from -1.175494E-38 to $3.402823 \mathrm{E}+38$.

## 2. Relationship between communication value and numerical value.

The numerical value may not be the same as the communication value, it is important to notice this. The following table shows how they respond to each other.

| Parameters | Relationship | Unit | Format code |
| :---: | :---: | :---: | :---: |
| System parameters | Numerical value equals to communication value | No unit | F1 |
| Run time | T=Rx/100 | Hour | F2 |
| Clock | Numerical value equals to communication value | Unit of time | F3 |
| Energy(primary) | $E p=R x / 10$ | kWh | F4 |
| Reactive energy(primary) | $E q=R x / 10$ | kvarh | F5 |
| Apparent energy(primary) | $E s=R x / 10$ | kVA | F6 |
| Energy(secondary) | $E p=R x / 1000$ | kWh | F7 |
| Reactive energy (secondary) | $\mathrm{Eq}=\mathrm{Rx} / 1000$ | kvarh | F8 |
| Apparent energy (secondary) | $E s=R x / 1000$ | kVA | F9 |
| Frequency | $F=R x / 100$ | Hz | F10 |
| Voltage | $\mathrm{U}=\mathrm{Rx}$ X (PT1/PT2)/10 | V | F11 |
| Current, current demand | $1=R \times X(C T 1 / C T 2) / 1000$ | A | F12 |
| Power, demand | $\mathrm{P}=\mathrm{Rx} \times$ ( $\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | W | F13 |
| Reactive power, demand | $\mathrm{Q}=\mathrm{Rx} \times$ (PT1/PT2)X(CT1/CT2) | var | F14 |
| Apparent power, demand | $\mathrm{S}=\mathrm{Rx} \times$ (PT1/PT2)X(CT1/CT2) | VA | F15 |
| Power factor | $P F=R x / 1000$ | No unit | F16 |
| Unbalance factor | Unbl=(Rx/1000)X100\% | No unit | F17 |
| THD | THD $=(\mathrm{Rx} / 10000) \times 100 \%$ | No unit | F18 |
| Harmonics | HDn=(Rx/10000) $\times 100 \%$ | No unit | F19 |
| Total odd HD | $\mathrm{HDo}=(\mathrm{Rx} / 10000) \times 100 \%$ | No unit | F20 |
| Total even HD | HDe=(Rx/10000) X 100\% | No unit | F21 |
| Crest factor | $C F=R x / 1000$ | No unit | F22 |
| K factor | $K F=R x / 10$ | No unit | F23 |
| THFF | THFF=(Rx/10000) X 100\% | No unit | F24 |
| Phase angle | Phase angle $=R x / 10$ | Degree | F25 |
| Temperature | Temperature $=R \mathrm{R} / 10$ | ${ }^{\circ} \mathrm{C}$ | F26 |

Important Note: Regions from "System parameters settings" to "Data logging 3 settings" are the regions that can be set and modified. Please follow the rules when you communicate with the MIC-2.

1. When function code 10 H is used, one communication command can only modify contents in one region, such as "System parameters settings", "System status parameter", "Date and Time table", "Over/under limit alarming-Global settings", "Over/under limit alarming-Single settings", "I/O Modules settings", Data logging 1 settings,Data logging 2 settings,Data logging 3 settings. It can not be accomplished in one communication order to modify contents in both of two or more regions above.
2. When function code 03H is used, the rules and limitations described above will not be applied.

System parameters determine how the meter works. Please refer to Chapter 3 and Chapter 4 for more details.
Function code: 03 H for reading, 10 H for writing. Data type: word. Format code: F1.

| Address | Parameter | Default | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |

"System status" indicates what events happened in the meter, what kinds of flags are read by user and to be the index of the storage of the events. Flags should be cleared after being read by the controller, otherwise new data will not be stored properly.
Function code: 03 H for reading, 10 H for writing. Data type: word.

| Address | Parameter | Format code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |

| $1044 H$ | minute | F3 | $0 \sim 59$ | word | R/W |
| $1045 H$ | second | F3 | $0 \sim 59$ | word | R/W |

### 5.3.4 Over/Under limit alarming setting

This setting consists of global alarming settings and single channel alarming settings. Global alarming settings contain settings of all global variables. There are 16 groups of records with the same format. Function code: 03 H for reading, 10 H for writing. Please refer to Chapter 4 for more details.

Global alarming settings

| Address | Parameter | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: |
| 1046H | Global alarming enable | 0:disable; 1 :enable | word | R/W |
| 1047H | Alarming flash enable | 0:disable; 1 :enable | word | R/W |
| 1048H | Alarming channel enable setting | 0~65535 <br> BitO:channel 1 <br> 1 :enable; 0:disable <br> Bit 1 : channel $2 \ldots$ <br> Bit15: channel 16 | word | R/W |
| 1049H | Logical "And " between alarming setting | $0 \sim 255$ <br> Bit0: first logic switch <br> 1:enable;0:disable <br> Bit 1: second logic switch ... <br> Bit7: eighth logic switch | word | R/W |
| 104aH | Alarming output to DO1 setting | 0~65535 <br> Bit0: channel 1 output <br> 1 :enable;0:disable <br> Bit 1: channel 2 output ... <br> Bit15: channel 16 output | word | R/W |
| 104bH | Alarming output to DO2 setting | $0 \sim 65535$ <br> The same as previous | word | R/W |
| 104cH | Alarming output to DO3 setting | $0 \sim 65535$ <br> The same as previous | word | R/W |
| 104dH | Alarming output to DO4 setting | $0 \sim 65535$ <br> The same as previous | word | R/W |

Single channel alarming settings

| Address | Parameter | Format code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 104eH | First group: parameter code | F1 | 0~50 | word | R/W |
| 104fH | First group: comparison mode | F1 | 1: greater than; 2 : equal to; 3 : less than | word | R/W |
| 1050 H | First group: setpoint value | F10~F18 | Related with parameters | word | R/W |
| 1051 H | First group: delay | F1 | 0~3000(*10ms) | word | R/W |
| 1052H | First group: output to relay | F1 | 0:none, 1~8: related relay | word | R/W |
| 1053H~109dH | 2nd to 16th group |  | Same as the first group | word | R/W |

Alarming parameter code table

| Setting value | Alarming object | Setting value | Alarming object | Setting value | Alarming object |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | Frequency | 1 | V1 | 2 | V2 |
| 3 | V3 | 4 | Average phase voltage | 5 | V12 |
| 6 | V23 | 7 | V3 1 | 8 | Average line voltage |
| 9 | Line current of phase L1 | 10 | Line current of phase L1 | 11 | Line current of phase L3 |
| 12 | Average line current | 13 | Neutral current | 14 | Power of phase L1 |
| 15 | Power of phase L2 | 16 | Power of phase L3 | 17 | Power of all |
| 18 | Reactive power of phase L1 | 19 | Reactive power of phase L2 | 20 | Reactive power of phase L3 |
| 21 | Reactive power of all | 22 | Apparent power of phase L3 | 23 | Apparent power of phase L2 |
| 24 | Apparent power of phase L3 | 25 | Apparent power of all | 26 | PF of L1 |
| 27 | PF of L2 | 28 | PF of L3 | 29 | PF |
| 30 | Voltage unbalance factor U_unbl | 31 | Current unbalance factor I_unbl | 32 | Load characteristic(R/L/C) |
| 33 | THD_V1(V1 or V12) | 34 | THD_V2(V2 or V3 1) | 35 | THD_V3(V3 or V23) |
| 36 | Average THD_V | 37 | THD_I1 | 38 | THD_ 12 |
| 39 | THD_I3 | 40 | Average THD_I | 41 | Al1 sampling value |
| 42 | Al2 sampling value | 43 | Al3 sampling value | 44 | Al4 sampling value |
| 45 | Active power demand of all | 46 | Reactive power demand of all | 47 | Apparent power demand of all |
| 48 | Current demand of phase L1 | 49 | Current demand of phase L2 | 50 | Current demand of phase L3 |

I/O module setting changes will be made only if the corresponding I/O modules are installed, no changes will be made otherwise. Please check the I/O module connection status before doing any settings. Function code: 03 H for reading, 10 H for writing. Please refer to <<User's manual of extended I/O Modules>>for more details.

### 5.3.6 Metering parameter addresses

MIC-2

## Basic analogue measurements

There are two different modes to read basic analogue measurements, one is secondary mode, and another is primary mode. In primary mode, the numerical value in register of the MIC-2 equals to the real physical value. In secondary mode, the relationship between numerical value in register and the real physical value is shown in the following table. (Rx is the numerical value in register of the MIC-2)

Function code: 03 H for reading.

| Address | Parameter | Code | Relationship | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $4000 \mathrm{H} \sim 4001 \mathrm{H}$ | Frequency | F1 | $F=R x$ | float | R |
| $4002 \mathrm{H} \sim 4003 \mathrm{H}$ | Phase voltage V1 | F1 | $\mathrm{U}=\mathrm{Rx} \times$ (PT1/PT2) | float | R |
| $4004 \mathrm{H} \sim 4005 \mathrm{H}$ | Phase voltage V2 | F1 | $\mathrm{U}=\mathrm{Rx} \times$ (PT1/PT2) | float | R |
| 4006H~4007H | Phase voltage V3 | F1 | $\mathrm{U}=\mathrm{Rx} \times$ ( $\mathrm{PT} 1 / \mathrm{PT} 2)$ | float | R |
| $4008 \mathrm{H} \sim 4009 \mathrm{H}$ | Average voltage Vavg | F1 | $\mathrm{U}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2)$ | float | R |
| 400aH ~ 400bH | Line voltage V12 | F1 | $\mathrm{U}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2)$ | float | R |
| $400 \mathrm{cH} \sim 400 \mathrm{dH}$ | Line voltage V23 | F1 | $\mathrm{U}=\mathrm{Rx} \times$ (PT1/PT2) | float | R |
| $400 \mathrm{eH} \sim 400 \mathrm{fH}$ | Line voltage V3 1 | F1 | $\mathrm{U}=\mathrm{Rx} \times$ (PT1/PT2) | float | R |
| $4010 \mathrm{H} \sim 4011 \mathrm{H}$ | Average line voltage Vlavg | F1 | $\mathrm{U}=\mathrm{Rx} \times$ (PT1/PT2) | float | R |
| $4012 \mathrm{H} \sim 4013 \mathrm{H}$ | Phase(line)current 11 | F1 | $1=R \times \times$ (CT1/CT2) | float | R |
| $4014 \mathrm{H} \sim 4015 \mathrm{H}$ | Phase(line)current 12 | F1 | $1=R x \times$ (CT 1/CT2) | float | R |
| $4016 \mathrm{H} \sim 4017 \mathrm{H}$ | Phase(line)current I3 | F1 | $1=R x \times$ (CT1/CT2) | float | R |
| $4018 \mathrm{H} \sim 4019 \mathrm{H}$ | Average current lavg | F1 | $1=R x \times(C T 1 / C T 2)$ | float | R |
| $401 \mathrm{aH} \sim 401 \mathrm{bH}$ | Neutral current In | F1 | $1=R x \times(C T 1 / C T 2)$ | float | R |
| $401 \mathrm{cH} \sim 401 \mathrm{dH}$ | Phase L1 power $P$ | F1 | $\mathrm{P}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $401 \mathrm{eH} \sim 401 \mathrm{fH}$ | Phase L2 power $P$ | F1 | $\mathrm{P}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $4020 \mathrm{H} \sim 4021 \mathrm{H}$ | Phase L3 power $P$ | F1 | $\mathrm{P}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $4022 \mathrm{H} \sim 4023 \mathrm{H}$ | System power Psum | F1 | $\mathrm{P}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $4024 \mathrm{H} \sim 4025 \mathrm{H}$ | Phase L1 reactive power Q | F1 | $\mathrm{Q}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| 4025H~4027H | Phase L2 reactive power Q | F1 | $\mathrm{Q}=\mathrm{R} \times \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $4028 \mathrm{H} \sim 4029 \mathrm{H}$ | Phase L3 reactive power Q | F1 | $\mathrm{Q}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| 402aH ~ 402bH | System reactive power Qsum | F1 | $\mathrm{Q}=\mathrm{R} \times \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| 402cH~402dH | Phase L1 apparent power S | F1 | $\mathrm{S}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $402 \mathrm{eH} \sim 402 \mathrm{fH}$ | Phase L2 apparent power S | F1 | $\mathrm{S}=\mathrm{R} \times \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $4030 \mathrm{H} \sim 4031 \mathrm{H}$ | Phase L3 apparent power S | F1 | $\mathrm{S}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $4032 \mathrm{H} \sim 4033 \mathrm{H}$ | System apparent power Ssum | F1 | $\mathrm{S}=\mathrm{R} x \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $4034 \mathrm{H} \sim 4035 \mathrm{H}$ | Phase L1 power factor PF | F1 | $P F=R x$ | float | R |
| $4036 \mathrm{H} \sim 4037 \mathrm{H}$ | Phase L2 power factor PF | F1 | $P F=R x$ | float | R |
| 4038H~4039H | Phase L3 power factor PF | F1 | $P F=R x$ | float | R |
| 403aH~403bH | System power factor PFsum | F1 | $P F=R x$ | float | R |
| $403 \mathrm{cH} \sim 403 \mathrm{dH}$ | Voltage unbalance factor U_unbl | F1 | Unbalance $=R x \times 100 \%$ | float | R |
| $403 \mathrm{eH} \sim 403 \mathrm{fH}$ | Current unbalance factor I_unbl | F1 | Unbalance $=R x \times 100 \%$ | float | R |
| $4040 \mathrm{H} \sim 4041 \mathrm{H}$ | Load characteristic(L/C/R) | F1 | 76.0/67.0/82.0(ASCII) | float | R |
| $4042 \mathrm{H} \sim 4043 \mathrm{H}$ | Power demand | F1 | $\mathrm{P}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $4044 \mathrm{H} \sim 4045 \mathrm{H}$ | Reactive power demand | F1 | $\mathrm{P}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |
| $4046 \mathrm{H} \sim 4047 \mathrm{H}$ | Apparent power demand | F1 | $\mathrm{P}=\mathrm{Rx} \times(\mathrm{PT} 1 / \mathrm{PT} 2) \times(\mathrm{CT} 1 / \mathrm{CT} 2)$ | float | R |

## Real time energy measurement

Data stored in this block can be preset or cleared.
Function code: 03H for reading, 10H for writing. Data type: dword.

It can be set as primary energy or secondary energy according to user. Please refer to F7, F8, and F9 for more details about the relationship between numerical value in register and the real physical value.

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4048H~4049 H | Energy IMP | F4/F7 | 0~999999999 | dword | R/W |
| 404aH $\sim 404 \mathrm{bH}$ | Energy EXP | F4/F7 | 0~999999999 | dword | R/W |
| 404cH ~ 404dH | Reactive energy IMP | F5/F8 | 0~999999999 | dword | R/W |
| $404 \mathrm{eH} \sim 404 \mathrm{fH}$ | Reactive energy EXP | F5/F8 | 0~999999999 | dword | R/W |
| $4050 \mathrm{H} \sim 4051 \mathrm{H}$ | Energy TOTAL | F4/F7 | 0~999999999 | dword | R/W |
| $4052 \mathrm{H} \sim 4053 \mathrm{H}$ | Energy NET | F4/F7 | 0~999999999 | dword | R/W |
| $4054 \mathrm{H} \sim 4055 \mathrm{H}$ | Reactive energy TOTAL | F5/F8 | 0~999999999 | dword | R/W |
| $4056 \mathrm{H} \sim 4057 \mathrm{H}$ | Reactive energy NET | F5/F8 | 0~999999999 | dword | R/W |
| $4058 \mathrm{H} \sim 4059 \mathrm{H}$ | Apparent energy | F6/F9 | 0~999999999 | dword | R/W |

### 5.3.6 Metering parameter addresses

## Harmonics

THD, Harmonics, odd HD, even HD, Crest Factor, THFF, K factor etc are all stored here. The data type is "word". Voltage parameters refer to line voltage when it is set to "2LL/3LL" and phase voltage for others. Function code: 03 H for reading.

The following are the THD of voltage and current

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 405aH | THD_V1 of V1(V12) | F18 | 0~10000 | word | R |
| 405bH | THD_V1 of V2(V31) | F18 | 0~10000 | word | R |
| 405 cH | THD_V1 of V3(V23) | F18 | 0~10000 | word | R |
| 405 dH | Average THD_V | F18 | 0~10000 | word | R |
| 405 eH | THD_11 | F18 | 0~10000 | word | R |
| 405fH | THD_I2 | F18 | 0~10000 | word | R |
| 4060 H | THD_13 | F18 | 0~10000 | word | R |
| 4061 H | Average THD_I | F18 | 0~10000 | word | R |

Voltage Harmonics, even HD, odd HD, Crest Factor are shown as below

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4062H~407fH | Harmonics of V1(V12) (the 2nd to 31st) | F19 | 0~10000 | word | R |
| 4080 H | Odd HD of V1 (V12) | F20 | 0~10000 | word | R |
| 4081H | Even HD of V1(V12) | F21 | 0~10000 | word | R |
| 4082H | Crest Factor of V1(V12) | F22 | 0~65535 | word | R |
| 4083H | THFF of V1 (V12) | F24 | 0~10000 | word | R |
| 4084H~40a5H | Parameters of V2(V3 1) | Same as V1 |  | word | R |
| 40a6H~40c7H | Parameters of V3(V23) | Same as V1 |  | word | R |

Current Harmonics, even HD, odd HD, Crest Factor are shown as below

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $40 \mathrm{c} 8 \mathrm{H} \sim 40 \mathrm{e} 5 \mathrm{H}$ | Harmonics of 11 (the 2nd to 31 st) | F19 | 0~10000 | word | R |
| 40e6H | Odd HD of 11 | F20 | 0~10000 | word | R |
| 40e7H | Even HD of 11 | F21 | 0~10000 | word | R |
| 40 e 8 H | K Factor of 11 | F23 | 0~65535 | word | R |
| $40 \mathrm{e} 9 \mathrm{H} \sim 4109 \mathrm{H}$ | Parameters of I2 | Same as 11 |  | word | R |
| $410 \mathrm{aH} \sim 412 \mathrm{aH}$ | Parameters of I3 | Same as 11 |  | word | R |

### 5.3.6 Metering parameter addresses

## MAX/MIN records

MAX/MIN value and time stamp. Function code: 03 H for reading.

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4136H | MAX of V1 | F11 | -32768~32767 | int | R |
| $4137 \mathrm{H} \sim 413 \mathrm{cH}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 413 dH | MAX of V2 | F11 | -32768~32767 | int | R |
| $413 \mathrm{eH} \sim 4143 \mathrm{H}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 4144H | MAX of V3 | F11 | -32768~32767 | int | R |
| $4145 \mathrm{H} \sim 414 \mathrm{aH}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 414bH | MAX of V12 | F11 | -32768~32767 | int | R |
| $414 \mathrm{cH} \sim 4151 \mathrm{H}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 4152H | MAX of V23 | F11 | -32768~32767 | int | R |
| $4153 \mathrm{H} \sim 4158 \mathrm{H}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 4159H | MAX of V3 1 | F11 | -32768~32767 | int | R |
| $415 \mathrm{aH} \sim 415 \mathrm{fH}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 4160 H | MAX of 11 | F12 | -32768~32767 | int | R |
| $4161 \mathrm{H} \sim 4166 \mathrm{H}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 4167H | MAX of 12 | F12 | -32768~32767 | int | R |
| $4168 \mathrm{H} \sim 416 \mathrm{dH}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 416 eH | MAX of I3 | F12 | -32768~32767 | int | R |
| $416 \mathrm{fH} \sim 4174 \mathrm{H}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 4175H | MAX of system power | F13 | -32768~32767 | int | R |
| $4176 \mathrm{H} \sim 417 \mathrm{bH}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 417 cH | MAX of system reactive power | F14 | -32768~32767 | int | R |
| $417 \mathrm{dH} \sim 4182 \mathrm{H}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 4183H | MAX of system apparent power | F15 | -32768~32767 | int | R |
| $4184 \mathrm{H} \sim 4189 \mathrm{H}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 418aH | MAX of power factor | F16 | -32768~32767 | int | R |
| $418 \mathrm{bH} \sim 4190 \mathrm{H}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 4191H | MAX of frequency | F10 | -32768~32767 | int | R |

## MAX/MIN records

MAX/MIN value and time stamp. Function code: 03 H for reading.

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4136H | MAX of V1 | F11 | -32768~32767 | int | R |
| $4137 \mathrm{H} \sim 413 \mathrm{cH}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 413 dH | MAX of V2 | F11 | -32768~32767 | int | R |
| $413 \mathrm{eH} \sim 4143 \mathrm{H}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 4144H | MAX of V3 | F1 1 | -32768~32767 | int | R |
| 4192H~4197H | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 4198H | MAX of power demand | F13 | -32768~32767 | int | R |
| $4199 \mathrm{H} \sim 419 \mathrm{eH}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 419fH | MAX of reactive power demand | F14 | -32768~32767 | int | R |
| 41aOH~41a5H | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 41a6H | MAX of apparent power demand | F15 | -32768~32767 | int | R |
| 41a7H~41acH | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 41adH | MAX of voltage unbalance factor | F17 | -32768~32767 | int | R |
| 41aeH~41b3H | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 41 b 4 H | MAX of current unbalance factor | F17 | -32768~32767 | int | R |
| 41b5H~41baH | Time stamp: yyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 41 bbH | MAX of V1(V12) THD | F18 | -32768~32767 | int | R |
| $41 \mathrm{bcH} \sim 41 \mathrm{clH}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 41 c 2 H | MAX of V2(V3 1) THD | F18 | -32768~32767 | int | R |
| $41 \mathrm{c} 3 \mathrm{H} \sim 41 \mathrm{c} 8 \mathrm{H}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 41 c 9 H | MAX of V3(V23) THD | F18 | -32768~32767 | int | R |
| $41 \mathrm{caH} \sim 41 \mathrm{cfH}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 41 dOH | MAX of 11 THD | F18 | -32768~32767 | int | R |
| 41d1H~41d6H | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 41 d 7 H | MAX of I2 THD | F18 | -32768~32767 | int | R |
| $41 \mathrm{~d} 8 \mathrm{H} \sim 41 \mathrm{ddH}$ | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | time | int | R |
| 41 deH | MAX of I3 THD | F18 | -32768~32767 | int | R |
| $41 \mathrm{dfH} \sim 41 \mathrm{e} 4 \mathrm{H}$ | Time stamp: yyy:mm:dd:hh:mm:ss | F3 | time | int | R |

The addresses for the MIN value of the above parameters are located in 41 e 5 H to 4293 H . They have the same format as the MAX value.

### 5.3.6 Metering parameter addresses

## Sequence component

U1 (U12), II consist of a real part and complex part. They have positive sequence, negative sequence and zero sequence. Data type is "int". Function code: 03 H for reading.

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4294H | positive sequence real part of V1 | F11 | -32768~32767 | int | R |
| 4295H | positive sequence complex part of V1 | F11 | -32768~32767 | int | R |
| 4296H | negative sequence real part of V1 | F1 1 | -32768~32767 | int | R |
| 4297H | negative sequence complex part of V1 | F11 | -32768~32767 | int | R |
| 4298H | zero sequence real part of V 1 | F11 | -32768~32767 | int | R |
| 4299H | zero sequence complex part of V1 | F1 1 | -32768~32767 | int | R |
| 429aH | positive sequence real part of 11 | F12 | -32768~32767 | int | R |
| 429bH | positive sequence complex part of 11 | F12 | -32768~32767 | int | R |
| 429cH | negative sequence real part of 11 | F12 | -32768~32767 | int | R |
| 429dH | negative sequence complex part of 11 | F12 | -32768~32767 | int | R |
| 429 eH | zero sequence real part of I1 | F12 | -32768~32767 | int | R |
| 429fH | zero sequence complex part of I1 | F12 | -32768~32767 | int | R |

## Phase angle

All voltage and current's phase angles corresponding to V1 (V12) are stored here. You can find out the phase sequence according to them. Data type is "word". Function code: 03 H for reading.

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 42aOH | phase angle of V2 to V1 | F25 | 0~3600 | word | R |
| 42a1H | phase angle of V3 to V1 | F25 | 0~3600 | word | R |
| 42a2H | phase angle of 11 to V1 | F25 | 0~3600 | word | R |
| 42a3H | phase angle of 12 to V1 | F25 | 0~3600 | word | R |
| 42a4H | phase angle of I3 to V1 | F25 | 0~3600 | word | R |
| 42a5H | phase angle of V23 to V12 | F25 | 0~3600 | word | R |
| 42a6H | phase angle of 11 to V12 | F25 | 0~3600 | word | R |
| 42a7H | phase angle of 12 to V12 | F25 | 0~3600 | word | R |
| 42a8H | phase angle of I3 to V12 | F25 | 0~3600 | word | R |

## Alarming records

There are 16 groups of records with the same format. Function code: 03 H for reading, 10 H for writing. Please refer to Chapter 4 for more details.

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 42a9H | First group: alarming status | F1 | 0~65535 | word | R |
| 42aaH | First group: alarming parameter code | F1 | 0~50 | word | R |
| 42abH | First group: over/under limit or reset value | F10~F18 | Related with parameters | word | R |
| 42acH~42b2H | First group: Time stamp: yyyy:mm:dd:hh:mm:ss:ms | F3 |  | word | R |
| 42b3H~42bcH | Second group | Same as the first group |  |  |  |
| 42bdH~42c6H | Third group | Same as the first group |  |  |  |
| $42 \mathrm{c} 7 \mathrm{H} \sim 42 \mathrm{dOH}$ | Fourth group | Same as the first group |  |  |  |
| 42d1H~42daH | Fifth group | Same as the first group |  |  |  |
| $42 \mathrm{dbH} \sim 42 \mathrm{e} 4 \mathrm{H}$ | Sixth group | Same as the first group |  |  |  |
| 42e5H~42eeH | Seventh group | Same as the first group |  |  |  |
| 42efH $\sim 42 \mathrm{f8H}$ | Eighth group | Same as the first group |  |  |  |
| $42 \mathrm{f9H} \sim 4302 \mathrm{H}$ | Ninth group | Same as the first group |  |  |  |
| 4303H~430cH | Tenth group | Same as the first group |  |  |  |
| 430dH~4316H | Eleventh group | Same as the first group |  |  |  |
| $4317 \mathrm{H} \sim 4320 \mathrm{H}$ | Twelfth group | Same as the first group |  |  |  |
| $4321 \mathrm{H} \sim 432 \mathrm{aH}$ | Thirteenth group | Same as the first group |  |  |  |
| 432bH~4334H | Fourteenth group | Same as the first group |  |  |  |
| $4335 \mathrm{H} \sim 433 \mathrm{eH}$ | Fifteenth group | Same as the first group |  |  |  |
| $433 \mathrm{fH} \sim 4348 \mathrm{H}$ | Sixteenth group | Same as the first group |  |  |  |

### 5.3.6 Metering parameter addresses

MIC-2

## Counting number of $\mathbf{I} \mathbf{O}$ modules

DI are arranged according to expanded I/O module addresses, user can check out the counting number of DI along with those modules. The DI counting records are stored in a non-volatile memory and will not be erased during power off. They can be reset via communication and panel. Data type is "dword". Function code: 03 H for reading.

AXM-1011

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4349H~434aH | DI1 pulse counter number | F1 | 0~4294967295 | dword | R |

### 5.3.6 Metering parameter addresses

## AI input value

The output of Al is mapped to the range of $0 \sim 4095$ according to its sampling value using some algorithm. Data type is "word". Function code: 03H for reading. Please refer to <<User's manual of expanded I/O modules>> for more details.

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4385H | Al1 sampling value | F1 | 0~4095 | word | R |
| 4386 H | Al2 sampling value | F1 | 0~4095 | word | R |
| 4387H | Al3 sampling value | F1 | 0~4095 | word | R |
| 4388H | Al4 sampling value | F1 | 0~4095 | word | R |

## AO output

The output of AO is the actual value of output. Over/under limit or Data type is "float". Function code: 03H for reading. Please refer to <<User's manual of expanded I/O modules $\gg$ for more details.

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 438aH ~ 438bH | Value of A01 | F1 |  | float | R |
| 438cH $\sim 438 \mathrm{dH}$ | Value of A02 | F1 |  | float | R |

## SOE Records

There are 20 groups of records with the same format. Function code: 03H for reading. Before gathering SOE records, the selected I/O module must be SOE enabled. If the SOE enabled I/O module is not connected, SOE record logs will not be collected. Please refer to <<User's manual of expanded I/O modules>> for more details.

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4399H~439fH | First group: time stamp: yyy:mm:dd:hh:mm:ss:ms | F3 |  | word | R |
| 43a0H | First group: DI status | F1 |  | word | R |
| $43 \mathrm{alH} \sim 4438 \mathrm{H}$ | 2nd to 20th group |  |  | word | R |
| 4439H | I/O module of SOE | F1 | 0:none; <br> 1 :AXM-IO11; <br> 2:AXM-IO21; <br> 3:AXM-IO31; <br> 4:AXM-IO12; <br> 5:AXM-IO22; <br> 6:AXM-IO32 | word | R |

## Current demand

Include real-time current demand, the maximum current demand and time of occurance. Function code: 03 H for reading.

| Address | Parameter | Code | Range | Data type | Property |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4600H-4601H | Phase I1 current demand | F1 | $1=R \times \times$ (CT1/CT2) | float | R |
| $4602 \mathrm{H}-4603 \mathrm{H}$ | Phase 12 current demand | F1 | $1=R \times \times$ (CT1/CT2) | float | R |
| 4604H-4605H | Phase I3 current demand | F1 | $1=R \times \times$ (CT1/CT2) | float | R |
| 4606H | Max of Phase 11 current demand | F12 | -32768~32767 | int | R |
| 4607-460cH | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | Time | int | R |
| 460dH | Max of Phase I2 current demand | F12 | -32768~32767 | int | R |
| 460e-4613H | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | Time | int | R |
| 4614H | Max of Phase 13 current demand | F12 | -32768~32767 | int | R |
| 4615-461AH | Time stamp: yyyy:mm:dd:hh:mm:ss | F3 | Time | int | R |

### 5.3.6 Metering parameter addresses

## DI Status

Current DI status, if related I/O module isn't connected, the DI status will be set to 0 . Function code: 02 H for reading.

AXM-1011

| Address | Parameter | Range | Data type |
| :--- | :--- | :--- | :--- |
| 0000 H | DI | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0001 H | DI 2 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0002 H | DI3 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0003 H | DI4 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0004 H | DI5 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0005 H | DI6 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |

AXM-IO2 1

| Address | Parameter | Range | Data type |
| :--- | :--- | :--- | :--- |
| 0006 H | DI7 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0007 H | DI8 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0008 H | DI9 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0009 H | DI10 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |

AXM-I03 1

| Address | Parameter | Range | Data type |
| :--- | :--- | :--- | :--- |
| 000 aH | DI11 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 000 bH | DI12 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 000 cH | DI13 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 000 dH | DI14 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |

AXM-IO12

| Address | Parameter | Range | Data type |
| :--- | :--- | :--- | :--- |
| 000 HH | Dl15 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 000 fH | DI16 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0010 H | Dl17 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0011 H | Dl18 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0012 H | DI19 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0013 H | DI20 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |

AXM-I022

| Address | Parameter | Range | Data type |
| :--- | :--- | :--- | :--- |
| 0014 H | DI2 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0015 H | DI22 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0016 H | DI23 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0017 H | DI24 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |

AXM-I032

| Address | Parameter | Range | Data type |
| :--- | :--- | :--- | :--- |
| 0018 H | DI25 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 0019 H | DI26 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 001 aH | DI27 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
| 001 bH | DI28 | $1=\mathrm{ON}, 0=\mathrm{OFF}$ | bit |
